Tools and symbol overview

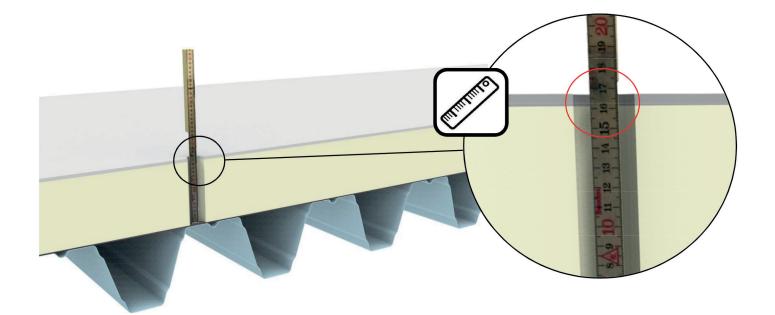

The following list presents the necessary tools for performing an efficient and correct installation of the Roof Console on warm trapeziodal roof

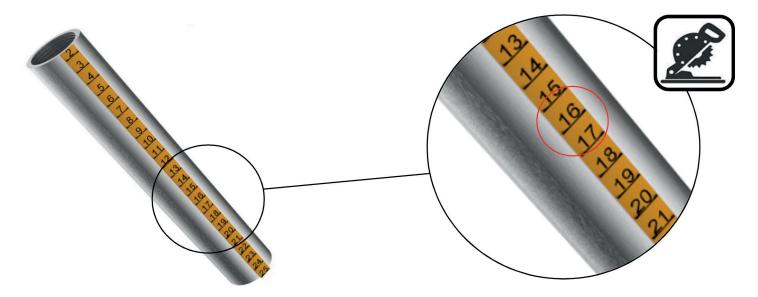

1. Console Adapter length-adjustment

2. Console Adapter length-adjustment

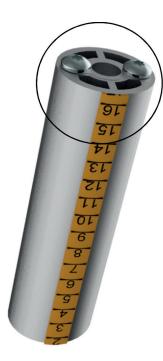

When the insulation thickness has been measured for each specific Roof Console location each of the Console Adapters must be cut to the correct length. This is easily done as a length indicator on the Console Adapter directly corresponds to the measured value and cutting the Adapter Adapter using the length indicator will ensure system compliance.

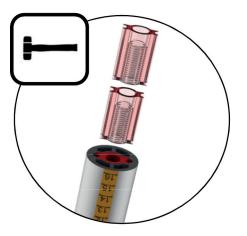

3. Console Adapter pre-assembly

Console Adapter overview

- 1. Console Adapter Thread Insert (M12)
- 2. Retaining Bolts
- 3. Console Adapter 150 or 300 mm

The first step in the assembly process is to insert the M12 Thread Insert into the Console Adapter basic profile. This is done by simply sliding the Insert in to the key hole and bring it to is intended position with an easy stroke of a soft hammer.

With the Thread Insert in position it must be constrained by turning in the two M6 bolts until they each reach their natural stop.

After the two bolts have been retained correctly the console is ready to be assembled with the Roof Console.

Constraining torque: 15 Nm

4. Roof Console pre-assembly

The pre-assembled Console Adapter must be installed by engaging the internal M35 thread with the M35 thread inside the Console housing.

The Console Adapter is turned with the hand until it reaches a natural stop whereafter it is tightened with a wrench or similar.

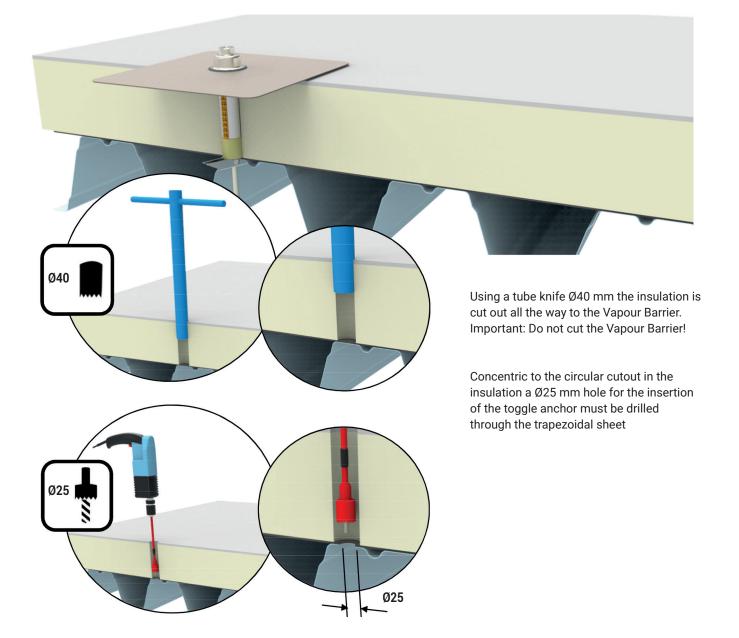

When the Console Adapter is mounted the installation the anchor can be initialized.

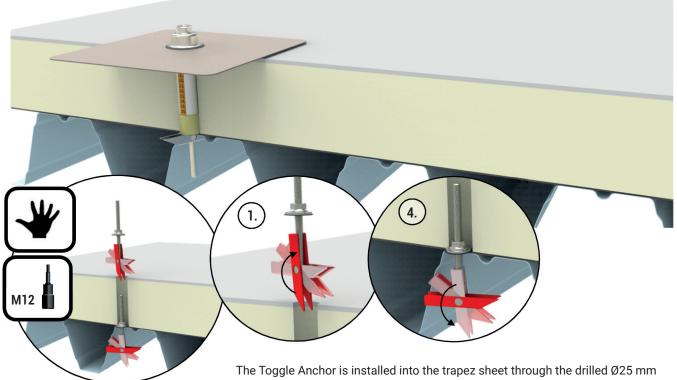

5. Anchor and Console Installation

(Insulation cut-out and drilling)

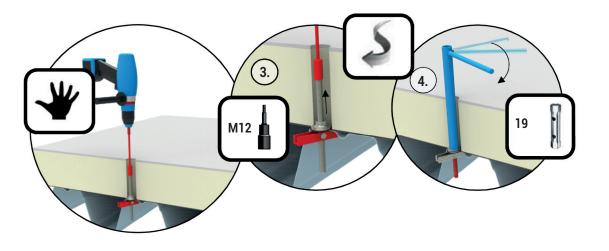

6. Anchor and Console Installation (Toggle Anchor)

hole by turning the toggle element to an upright position (Ilu. 1.). Once the Anchor has been inserted the Toggle Element falls back against the M12 Threaded Rod (Ilu. 2.) where a correct preadjustment ensures that the Element ends up in a horizontal position.

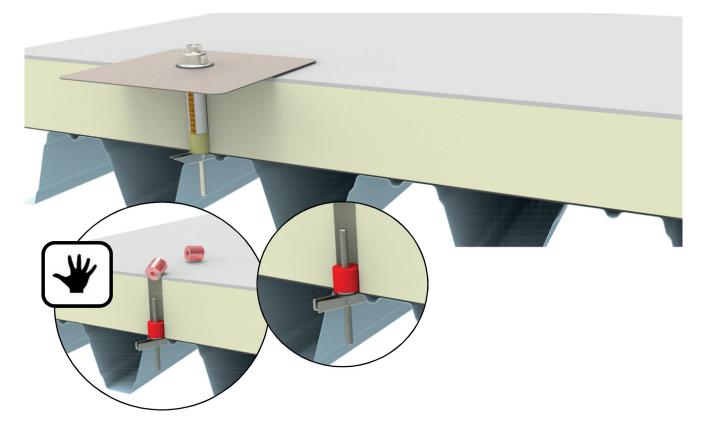

At this stage the M12 Bit Socket is engaged to the protuding M12 Threaded Rod (Ilu. 3.) and while pulling the Anchor upwards it is turned clock wise until it reaches it's final position.

As the last step the anchor is tightend using a 19 mm pipe socket.

7. Anchor and Console Installation (Insulation Tube)

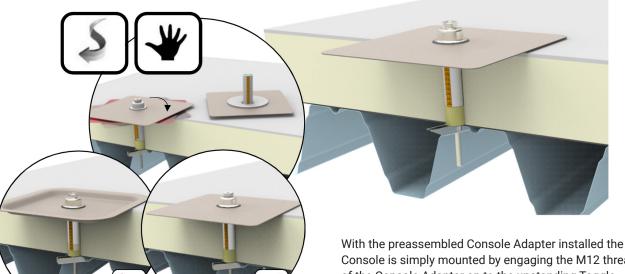

With the M12 Threaded end of the Toggle Anchor protuding up from the trapez deck the Ø40x30 mm insulation tube must be inserted.

8. Anchor and Console Installation (Console installation torching and welding)

Console is simply mounted by engaging the M12 thread of the Console Adapter on to the upstanding Toggle Anchor and turned clock wise to engage with the thread. When turning attention must be brought on obtaining good contact with the existing roof and not to over turn the console and hereby creating tensions in the membrane or unintended deformation of the supporting insulation.

Once the Console has been brought to the intended position in good contact with the general roofing surface and with it perimeter edges correctly aligned, the membrane of the console is either torched or welded to the existing roof. The welding process depends on the type membrane.

When the Roofer has compled the welding process the installaton of the Console is completed and the follwing installation of Collector Platforms, Heat Pump framing etc. can be initialized. Please refer to the specific FIXNORDIC installation guide line for more information.
